1.2.1 → Policy limits

→ Policy limits

→ def → Max amount the insurer will pay for a single loss

→ $X \wedge u = \begin{cases} X, & X < u \\ u, & X \geq u \end{cases}$

↓ limited loss variable

capped at u ⇒ pay whichever is lower, X or u

→ Limited expected value → $E(X\wedge u) = \int_0^u x f(x)\,dx + \underbrace{\int_u^\infty u f(x)\,dx}_{= u S(u)}$

→ Extended to k^{th} moment → $E[(X\wedge u)^k] = \int_0^u x^k f(x)\,dx + u^k S(u)$

→ Alternative calculation ⟶

$E(g(X)) = \int_0^\infty g'(x) S(x)\,dx$

↑ Always zero, regardless of domain of RV

X → must be non-negative

$g(0) = 0$

→ $E[X\wedge u] = \int_0^u S(x)\,dx$

$E[(X\wedge u)^k] = \int_0^u k x^{k-1} S(x)\,dx$

→ Mixtures → Even w/ these, formulas for $E[(X\wedge u)^k]$ works by taking the weighted average of the raw moments for each component

$\underset{\text{mixture}}{E(X\wedge u)} = \sum_{i=1}^n w_i E[X_i\wedge u]$

→ Assignment

→ Q1) $f(x) = \frac{375000}{x^4}, \; x > 50$

$V(X\wedge 500) = E[(X\wedge 500)^2] - (E(X\wedge 500))^2$

$= \left[\int_{50}^{500} x^2 f(x)\,dx + \int_{500}^\infty 500^2 f(x)\,dx\right] - \left[\int_{50}^{500} x f(x)\,dx + \int_{500}^\infty 500 f(x)\,dx\right]^2$

$= \langle \ldots \rangle$

$= (6750 + 250) - (74.25 + 0.5)^2$

$= 1412.4375$

OR

$X \sim$ SP Pareto ($\alpha = 3$, $\theta = 50$)

$E[(X\wedge 500)^2] = \frac{\alpha\theta^k}{\alpha-k} - \frac{k\theta^\alpha}{(\alpha-k)x^{\alpha-k}}$

$= \frac{3(50^2)}{3-2} - \frac{2(50^3)}{(3-2)500^{3-2}}$

$= 7000$

$E(X\wedge 500) = \frac{3(50)}{3-1} - \frac{50^3}{(3-1)500^{3-1}}$

$= 74.75$

$V(X\wedge 500) = 7000 - 74.75^2$

$= 1412.4375$

1.2.2 → Deductibles

→ def → Deductible is the amount the policyholder is responsible for paying before the insurer will pay anything on the claim

→ Two types → ordinary & franchise deductibles

→ Ordinary deductibles

→ From the policyholder perspective, deductibles act as a cap/limit

$\boxed{X\wedge d = \begin{cases} X & X<d \\ d & X\geq d\end{cases}}$

→ The insurer then pays the remaining amount

$\boxed{(X-d)_+ = \begin{cases} 0 & X\leq d \\ X-d & X>d \end{cases}}$

→ Full loss amount = sum of parts

$\underset{= \min(X,d)}{(X\wedge d)} + \underset{\max(X-d,\,0)}{(X-d)_+} = X$

⇒ $E(X\wedge d) + E((X-d)_+) = E(X)$

⇒ Expected insurance payment can be calculated as

✫ $E[(X-d)_+] = E(X) - E(X\wedge d)$

→ recommended formula b/c pieces are easy to find / given in table

→ ✫ Does not hold for higher moments

$E[(X-d)_+^2] \neq E(X^2) - E[(X\wedge d)^2]$

⇒ need to use integration

$E[(X-d)_+] = \int_0^d \overset{\text{below}}{0\, f(x)\,dx} + \int_d^\infty \overset{\text{above}}{(x-d) f(x)\,dx}$

$= 0 + \ldots$

→ can be extended to the k^{th} moment too

$E[(X-d)_+^k] = \int_d^\infty (x-d)^k f(x)\,dx$

using survival method $= \int_d^\infty S(x)\,dx$

k^{th} moment → $E[(X-d)_+^k] = \int_d^\infty k(x-d)^{k-1} S(x)\,dx$

⟶ Loss Elimination ratio (LER) → measures how much the insurer saves by imposing an ordinary deductible

⇒ $\boxed{LER = \frac{E(X\wedge d)}{E(X)}}$

→ Payment per loss vs per payment

→ ex) losses: 2 3 7 9 14

Policy has an ordinary deductible of 5

→ Expected payment per loss = $\frac{\text{Total payment}}{\#\text{ losses}} = \frac{0+0+2+4+9}{5} = 3$

→ Expected payment per payment = $\frac{\text{Total payment}}{\#\text{ payments}} = \frac{2+4+9}{3} = 5$

⇒ $\underset{\text{payment per payment RV}}{E[Y^P]} \geq \underset{\text{payment per loss RV}}{E[Y^L]}$

→ Formulas

→ $E[Y^L] = E[(X-d)_+]$

→ $E[Y^P] = E[Y^L \mid Y^L > 0]$

↓ $= E[X-d \mid X>d]$

→ $f(x \mid X>d) = \frac{f(x)}{1-F(d)} = \frac{f(x)}{S(d)}, \; x>d$

⇒ $E(Y^P) = E[X-d \mid X>d]$

$= \int_d^\infty (x-d) f(x\mid X>d)\,dx$

$= \int_d^\infty (x-d) \frac{f(x)}{S(d)}\,dx$

$= \frac{1}{S(d)}\int_d^\infty (x-d) f(x)\,dx$

$= \frac{E[(X-d)_+]}{S(d)}$

$= \frac{E[Y^L]}{S(d)}$

→ Easier way to switch between expected payment per payment & expected payment per loss

$\boxed{E(Y^P) = \frac{E(Y^L)}{S(d)} \iff E(Y^L) = E(Y^P)S(d)}$

→ works for higher order moments too $E[(Y^P)^k] : E[(Y^L)^k]\, S(d) \iff \langle\ldots\rangle$

→ Y^L is the general notation for payment per loss RV & is not ALWAYS $(X-d)_+$ (only when there is an ordinary deductible & no other coverage modifications)

→ with no deductible, $Y^P = Y^L$ (all losses are payments)

→ Example → losses $X \sim$ Exponential ($\lambda = 1/500$) w/ ordinary deductible of 100

→ define variables → $Y^L = (X-100)_+$

$Y^P = X-100 \mid X>100$

→ Goal → $V(Y^P) = E[(Y^P)^2] - (E(Y^P))^2 = ??$

→ $E(Y^P) = \frac{E(Y^L)}{S(d)}$

$= \frac{E(X) - E(X\wedge d)}{e^{-d\lambda}}$ ↪ $= \theta(1-e^{-x/\theta})$; $d = 100$

$= \frac{\frac{1}{1/500} - 90.63}{0.8187}$

$= 500$

→ $E[(Y^L)^2] = \int_d^\infty 2(x-d) S(x)\,dx$

$= \int_d^\infty 2(x-100) e^{-x/500}\,dx$

$= \langle\ldots\rangle$

$= 409{,}365.3765$

$E[(Y^P)^2] = \frac{E[(Y^L)^2]}{S(d)}$

$= 500{,}000$

⇒ $V(Y^P) = 500{,}000 - 500^2$

$= 250{,}000$

OR

$Y^P = X-d \mid X>d \sim \text{Exp}(1/500)$ by memoryless property

⇒ $V(Y^P) = V(\text{Exp}(1/500))$

$= 250{,}000$

→ def → $X\wedge d$ = limited loss variable

$X-d \mid X>d$ = excess loss variable

e(d) = mean excess loss function

↓ $= E[X-d \mid X>d]$

→ Shortcuts for mean excess loss functions

Loss	Mean	Excess Loss	Mean Excess Loss
Exp(θ)	θ	Exp(θ)	θ
Uniform(a, b)	$\frac{a+b}{2}$	Uniform(0, b−d)	$\frac{b-d}{2}$
Pareto(α, θ)	$\frac{\theta}{\alpha-1}$	Pareto(α, θ+d)	$\frac{\theta+d}{\alpha-1}$
S-P Pareto(α, θ)	$\frac{\alpha\theta}{\alpha-1}$	Pareto(α, θ)	$\frac{d}{\alpha-1}$
Beta(1, b, θ)	$\frac{\theta}{1+b}$	Beta(1, b, θ−d)	$\frac{\theta-d}{1+b}$

→ Franchise deductibles

→ def → pays full amount of losses over the deductible (in contrast to ordinary deductible which only pays amount in excess of the deductible)

$\boxed{Y^L = \begin{cases} 0 & X\le d \\ X & X>d\end{cases}}$

→ Expected values → $E(Y^L) = \int_d^\infty x f(x)\,dx$

$= \int_d^\infty x f(x)\,dx - \int_d^\infty d\, f(x)\,dx + \int_d^\infty d\, f(x)\,dx$

$= \int_d^\infty (x-d) f(x)\,dx + d\int_d^\infty f(x)\,dx$

$= E[(X-d)_+] + d\,S(d)$

⇒ $E[Y^P] = \frac{E(Y^L)}{S(d)}$

$= \frac{E[(X-d)_+] + d\,S(d)}{S(d)}$

$= e(d) + d$

→ Example → $X \sim$ Pareto ($\alpha = 2.5$, $\theta = 100$)

→ $E(Y^P) = e(d) + d$

↳ $X-d \mid X>d \sim \text{Pareto}(\alpha, \theta+d)$

⇒ $e(d) = E[X-d \mid X>d]$

↓ $= \frac{\theta+d}{\alpha-1}$

$= \frac{100+50}{2.5-1} + 50$

$= 150$

→ Impact of deductibles on claim frequency

→ Recall # losses ≠ # payments necessarily when there is a deductible d

→ If # of losses N is modelled by an (a, b, 0) class distribution, the # of payments N' will follow the same distribution, but w/ modified parameters

Dist	N	N'
Poisson	λ	$v\lambda$
Binomial	n, p	n, vp
NB	r, β	$r, v\beta$

where v is the prob of a loss being greater than the deductible $P(X>d)$ = prob of a payment

---

→ Assignment

→ Q1) $X \sim \text{Exp}(\theta)$

↓ ✓ $= 1213.061$

1.2.3 → Coinsurance

→ def → Coinsurance is the portion of the loss the insurer is responsible for

→ Suppose loss X → insurer pays αX, $0<\alpha<1$ & policyholder pays $(1-\alpha)X$

→ Of course $E(\alpha X) = \alpha E(X)$

→ Coinsurance & deductible → Coinsurance comes into play After the deductible is met

→ $Y^L = \begin{cases} 0 & X\le d \\ \alpha(X-d) & X>d\end{cases}$

→ $E(Y^L) = \alpha[E(X) - E(X\wedge d)]$

→ If coinsurance is applied before the deductible, then instead of applying the entire loss X against the deductible, the insurer will only apply the coinsured portion of the loss, αX. The policyholder will still be responsible for the remaining portion $(1-\alpha)X$ + amount needed to meet deductible

⇒ $Y^L = \begin{cases} 0 & \alpha X\le d \\ \alpha X - d & \alpha X > d\end{cases}$

↓ $= \begin{cases} 0 & X \le \frac{d}{\alpha} \\ \alpha(X - \frac{d}{\alpha}) & X > \frac{d}{\alpha}\end{cases}$

→ ex) if $\alpha = 0.8$, $X = 3$, $d = 2$

After ⇒ payment = 0.8(3−2) = 0.8

Before ⇒ payment = 0.8(3)−2 = 0.4

⇒ to solve for Expected value, make the following adjustment

$E(Y^L) = \alpha[E(X) - E(X\wedge \frac{d}{\alpha})]$
